An Explanation of
CERTIFIED WELDING
National Certified Pipe Welding Bureau
Core Purposes of the NCPWB

To engage in research and educational work that will assist the contractor in furnishing the public with safe and dependable installations through the use of certified welding.

To keep members of the Bureau informed of the latest scientifically proven methods and supply information and data in connection with certified welding.

To establish uniform procedures that conform with ANSI/ASME Codes for various methods of welding and to promote and develop certified welding.

To assist the NCPWB member contractor in providing the owner with quality welding at reduced costs through the use of certified welding.

We Believe in Codes

The National Certified Pipe Welding Bureau has a deep and abiding belief in codes and has always promoted compliance with them. Such compliance produces sound welds and is economical for both contractor and owner. It saves resources that would otherwise be wasted in going back to correct errors.

Certified Welding

Qualified Procedures/Qualified Welders

The term certified welding is often used in the trade without knowledge of its meaning.

The contractor is required to certify that the welding procedure and the welder are qualified in accordance with the requirements of Section IX of the American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code.

This is where the term “certified welder” came into use. It is the contractor, certifying that the work will be done according to qualified welding procedures by welders who have been tested, and whose qualification test sheets are available, attesting to their ability to weld in accordance with the contractor’s Welding Procedure Specifications. Responsible contractors will provide their certified Welding Procedure Specifications and qualification test records attesting to the welder’s ability to perform in accordance with code requirements.

What is a Welding Procedure?

A procedure is the description of the technique adopted to perform quality welding as required by the applicable code.

Through the years, standards have been established for pipe dimensions, flange and fitting dimensions or various pressures, pipe thread dimensions, and pitch. The tool industry has provided cutting and threading tools for these standards, and everyone in the industry accepts them, giving little thought as to how they were established.

With the application of welding to pipe fabrication and installation, a standard was required. The standard qualifications for welding procedures, made in accordance with the ANSI/ASME Boiler and Pressure Vessel Code and the ANSI/ASME B31 Codes for Pressure Piping to ensure competent workmanship, are the generally accepted standards. The requirements are not complicated, but are frequently misunderstood.

The ASME Code simply states that those contractors responsible for providing welding shall establish a method (Welding Procedure Specification) and prove that sound welds can be made through the use of these procedures.
**Contractor/Membership**

Contractors who are members of the National Certified Welding Bureau can guarantee that the welding is performed in accordance with established national standards.

**Qualification of Procedures**

Section IX of the American Society of Mechanical Engineers Boiler and Pressure Vessel Code sets forth in complete detail the step-by-step process necessary to qualify a procedure, including the necessary tests to establish the results.

It is not easy to comply with these provisions. Qualifying a procedure can be a very expensive endeavor, particularly in the hands of the inexperienced. It is a matter of trial and error. The cost of materials, especially in alloys, can be very high, and many man-hours of technical supervision and labor can be expended before satisfactory results are obtained.

The code bodies recognized that requiring each welding fabricator or erector to qualify every welding procedure they were using would represent an extremely wasteful practice, and would cost American industry a great many unnecessary dollars without improving welding technology or fabricated product quality.

The Mechanical Contractors Association of America, Inc. recognized this fact and in 1944 organized the National Certified Pipe Welding Bureau for the purpose of jointly developing and qualifying procedures with its members. These Welding Procedure Specifications are written based on thoroughly tested and qualified Procedure Qualification Records (PQRs) donated by members of the NCPWB Technical Committee and reviewed by the Hartford Steam Boiler Inspection and Insurance Company before publication.

Under the B31 Codes for Pressure Piping, Welding Procedure Specifications that have been qualified by a technically competent group or agency, such as the NCPWB, may be used by other member companies of that group or agency, providing that each user of the procedure qualifies at least one welder using the Welding Procedure Specification and accepts responsibility for same. The provisions for use of procedures developed by the NCPWB for piping work covered by the rules of the ASME Boiler and Pressure Vessel Code are set forth in paragraph PW-28 of Section I of that code, and respective paragraphs of the ASME Codes for Pressure Piping: para. 127.5.3 for B31.1—Power Piping Code; para. 328.2 for B31.3—Process Piping Code; para. 527.5 for B31.5—Refrigeration Piping Code; and para. 927.5 for B31.9—Building Services Piping Code.

**Welding Procedure Qualification Responsibility**

Each employer shall be responsible for qualifying any welding procedure that he intends to have used by personnel of his organization. However, to avoid duplication of effort, and subject to approval of the owner, welding procedures qualified by a technically competent group or agency may be used. (Para. 127.5.3 ANSI/ASME B31.1—Power Piping)

**Documentation of Procedure Qualification**

The Welding Procedure Specification describes all the essential, non-essential, and supplementary essential (when required) variables for each welding process used in the Welding Procedure Specification. Welding Procedure Specifications jointly developed for use by Bureau members are documented on NCPWB Form QW-482.

Each Welding Procedure Specification shall reference the supporting Procedure Qualification Record(s), which is a record of variables recorded during the welding of the test coupon and the results of the tested specimens. The Procedure Qualification Record(s) that support the Bureau Welding Procedure Specifications are detailed on NCPWB Form QW-483.

The Bureau now has more than 100 Welding Procedure Specifications qualified in accordance with code requirements. The policy of the Bureau states Sample welding procedure supporting documentation.
that before any pipe welding is performed, the contractor member shall submit to the owner, or his authorized representative, a copy of his Welding Procedure Specifications with proof of its qualification.

All NCPWB Welding Procedure Specifications (WPSs) have been reviewed by the Hartford Steam Boiler Inspection and Insurance Company, which has stated in writing that the NCPWB WPSs meet the qualification requirements of Section IX, ASME Boiler and Pressure Vessel Code.

To reduce the amount of research and preparation time required to complete the NCPWB Form QW-484, the NCPWB has prepared for its membership pre-completed Welder Performance Qualification Test forms which have actual values and the ranges qualified for each essential variable completed. These forms have been prepared to meet the requirements of Section IX, ASME Boiler and Pressure Vessel Code for processes that are most commonly encountered in production welding or “code” work.

Welder Qualification and Renewal Requirements

Performance Qualification and Testing
The ASME Code specifies that welders shall be required to demonstrate their skill, under supervised tests, to make sound welds using the contractor’s Welding Procedure Specifications.

The ability of thousands of welders to make quality welds using National Certified Pipe Welding Bureau Welding Procedure Specifications has been proven for all types of piping materials in general use throughout the mechanical construction industry.

The National Certified Pipe Welding Bureau and the United Association of Journeymen & Apprentices of the Plumbing and Pipe Fitting Industry (UA) have consolidated their efforts to make the welder qualification process more cost effective for the construction user. Under the joint effort, union welders are tested at the UA Authorized Test Facilities under the supervision and control of a contractor representative and an Authorized Test Representative (ATR). All test coupons are radiographed by an independent testing laboratory to determine which of the welders taking the test qualified. Appropriate Welder Performance Qualification Test Record forms are completed and made available to UA signatory contractors through the UA and the NCPWB.

The requirements of ASME Section IX state that the Welding Procedure Specification under which the welder is to be qualified shall be followed in every respect when making test welds to qualify a welder. The WPSs used during the test will be those outlined in the UA Welder Certification Program Manual. For NCPWB members, the NCPWB national office has identified equivalent WPSs that conform to the essential variables provided in the UA WPSs.

To reduce the amount of research and preparation time required to complete the NCPWB Form QW-484, the NCPWB has prepared for its membership pre-completed Welder Performance Qualification Test forms which have actual values and the ranges qualified for each essential variable completed. These forms have been prepared to meet the requirements of Section IX, ASME Boiler and Pressure Vessel Code for processes that are most commonly encountered in production welding or “code” work.

For NCPWB members, the NCPWB national office has identified equivalent WPSs that conform to the essential variables provided in the UA WPSs.
Renewal of Welder Qualifications

Under ASME Section IX requirements, paragraph QW-322, the performance qualification test of a welder is considered permanently effective unless a welder does no welding for a period of six months or more, or where there is specific reason to question the welder’s ability to make sound welds. The UA and the NCPWB work closely with the contractors who employ the welders to document the dates when the welders last welded with a particular process and maintain records that show continuity of a welder’s qualification in accordance with paragraph QW-322.

NCPWB local chapters keep records of the names and social security numbers of thousands of welders qualified by NCPWB members and in the UA Authorized Test Facilities (ATFs).

To further facilitate the interchange of welders, NCPWB has established a National Welder Database. This database contains the names of welders along with the dates, locations, and processes on which they have qualified. The location identifies the NCPWB local chapter that has the welder’s original WPQ form signed by the qualifying contractor. This database continues to grow as more segments of the industry become familiar with the interchange provisions available under the Code.

Through this database, an NCPWB member contractor can determine the availability of qualified welders in any part of the United States.

Interchange of Welder Qualifications

Paragraph PW-28.5 of Section I of the ASME Code permits the interchange of welders among contractors using the same Welding Procedure Specifications for piping.

The ASME B31 Codes for Pressure Piping also provide for the interchange of welders. In paragraph 127.5.3 of ASME B31.1—Power Piping, it is specifically stated that to avoid duplication of effort, an employer may accept a Welder Performance Qualification (WPQ) made by a previous employer, subject to the approval of the owner or his agent, on piping using the same or equivalent procedure. To complete the interchange, the new employer shall obtain from the previous employer a copy of the WPQ that shows the name of the employer by whom the welder was qualified, the date of such qualification, and evidence that the welder has maintained qualification in accordance with paragraph QW-322 of Section IX.

Quality Is Economy In Pipe Welding

Remember, qualified procedures and proper performance qualifications are but two steps on the road toward welding quality. A third requirement is the continuing supervision and inspection during welding that is clearly the responsibility of the contractor. These three steps ensure a quality of work that can meet any final inspection and testing.

Welder Interchange

Welders and welding operators of a member manufacturer or contractor must pass their performance test on each of the organization’s Welding Procedure Specifications they are to weld under, except as otherwise permitted in Section IX. The Performance Qualification Test Records are placed on file with the organization. When such welders or welding operators are employed by another member manufacturer or contractor, their performance qualification records are made available to their new employer by the organization and performance requalification is not required for those Welding Procedure Specifications under which they qualified previously. (Interpretation I-78-06; ASME Boiler and Pressure Vessel Code.)

NCPWB Welding Procedure Specification Numbering System

The NCPWB Welding Procedure Specification numbering system clearly defines the type of metals to be welded, process used, and allows variations in a process. This numbering system will be used on all Welding Procedure Specifications revised or developed by the NCPWB in the future.

Welding Procedure Specification Number Format

- X-Y-Z (for a P-Number Base Metal welded to itself)
- X1:X2-Y-Z (for two different P-Number Metals welded to each other)
In this Numbering System

X is the P-Number of the Base Metal(s)
Y is the Welding Process Number based on the following list:

1. SMAW using F-3 electrodes (E6010, E7010-A1, E6011, etc.)
2. SMAW using other than F-3 electrodes (E7018, E308-16, etc.)
3. GTAW without consumable insert
4. GTAW with consumable insert
5. GMAW-S (Short Circuiting Transfer Mode)
6. GMAW (Globular, Spray, or Pulsed Transfer Mode)
7. FCAW (flux-cored wire variation of GMAW)
8. SAW
9. OFW

Z identifies a variation of a process

Z values are assigned in simple chronological sequence—identifying a variation of a process using the same base metals—with no consistent meaning from procedure to procedure.

Examples

WPS 1-12-1 (said as: WPS one dash twelve dash one)

This WPS would be Carbon Steel (P-1) to itself using an F-3 classification electrode followed by an electrode that is not an F-3 classification.

WPS 4:1-42-2 (said as: WPS four to one dash forty-two dash two)

This WPS is for welding Cr-Mo steels from P-Number 4 to carbon steel from P-Number 1 using GTAW with consumable insert followed by SMAW using an electrode which is not F-3.

Procedure Specifications for Pipe Welding

The Procedure Specifications listed below are the result of research. They have been developed by members or through technical representatives of the members of the NCPWB, and the costs thereof have been defrayed through the dues and contributions of members of the NCPWB. They are thus available to and for the use of NCPWB members only.
